

Spring Boot 3 Backend Summary

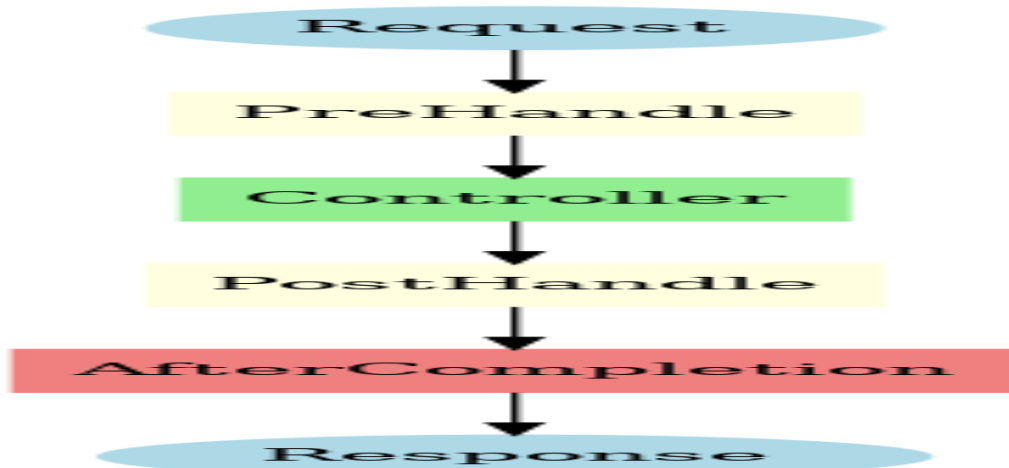

REST API Flow

Request goes from Client → Controller → Service → Repository → Database. Each layer has a clear separation of concern. Responses flow back in reverse order.

Interceptor Flow

Interceptors wrap around requests: PreHandle runs before controller, PostHandle after controller but before view rendering, and AfterCompletion runs after the request completes.

Kafka Flow

Producers publish events to Kafka Topics. Consumers subscribe to topics and process messages asynchronously. Enables decoupled, scalable event-driven systems.

HATEOAS + Pagination/Sorting

Spring HATEOAS allows responses to include navigation links. Pagination is supported with Pageable and Page. Sorting can be applied with Sort. Clients can navigate using provided links.
